## Office Action Summary

Application No.

09/891,200

Applicant(s)

SMOTKIN, EUGENE S.

Examiner

Raymond Alejandro

Art Unit

1745

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

### Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

### Status

- 1) ☒ Responsive to communication(s) filed on 22 November 2004.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

### Disposition of Claims

- 4) ☒ Claim(s) 75-92 is/are pending in the application.
- 4a) Of the above claim(s) 83 and 92 is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 75-82 and 84-91 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

### Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 26 June 2001 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
- Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

### Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

### Attachment(s)

- 1) ☐ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08)  
Paper No(s)/Mail Date \_\_\_\_\_.
- 4) ☐ Interview Summary (PTO-413)  
Paper No(s)/Mail Date. \_\_\_\_\_.
- 5) ☐ Notice of Informal Patent Application (PTO-152)
- 6) ☐ Other: \_\_\_\_\_.

Art Unit: 1745

## **DETAILED ACTION**

### ***Response to Amendment***

This office action is being provided in response to the amendment filed on 11/22/04. The applicant has overcome most of the objections and the 35 USC 112 rejections; and the 35 USC 102 rejection over Saito et al'672. Refer to the aforesaid amendment for additional details on applicant's rebuttal arguments. However, the present claims (claims 75-82 and 84-91) are finally rejected over the same art as the 35 USC 102 rejections and 35 USC 103 rejections still stand as set forth hereinafter and for the reasons of record:

### ***Election/Restrictions***

1. This application contains claims 83 and 92 drawn to an invention nonelected (election by original presentation) with traverse in Paper No. 08/18/04. A complete reply to the final rejection must include cancellation of nonelected claims or other appropriate action (37 CFR 1.144) See MPEP § 821.01.

### ***Claim Rejections - 35 USC § 112***

2. The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

3. Claims 78 and 87 are still rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the enablement requirement. The claim(s) contains subject matter which was not described in the specification in such a way as to enable one skilled in the art to which it pertains, or with which it is most nearly connected, to make and/or use the invention. It is noted that the

Art Unit: 1745

specification fails to clearly define the specific molar amounts "z", "y", "w" and "x" for the superprotonic water non-stoichiometric phase of  $M_zH_y(AsO_4)_w \cdot xH_2O$ ; and the molar amount "x" and the component "D" for the inorganic system without water comprising  $Cs_{1-x}(NH_4)_xH_2PO_4$ ,  $Cs_{1-x}(ND_4)_xD_2PO_4$ , or  $K_{1-x}(NH_4)_xH_2PO_4$ . Thus, the specification does not clearly set forth the metes and bounds of the patent protection desired.

*Note: On item 8 in the amendment of 11/22/04 applicant stated that these materials were deleted from the claims with the present amendment. However, claims 78 and 87 still recite such materials. Further clarification is thus required.*

#### ***Claim Rejections - 35 USC § 102***

4. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

#### ***Claim Rejections - 35 USC § 103***

5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Art Unit: 1745

6. Claims 75-77, 82, 84-86 and 91 are rejected under 35 U.S.C. 102(b) as anticipated by or, in the alternative, under 35 U.S.C. 103(a) as obvious over Smotkin et al 5846669.

The present application is now directed to a component wherein the disclosed inventive concept comprises the coated support.

Regarding claims 75, 82, 84 and 91:

Smotkin et al disclose an electrolyte system for fuel cells comprising an acid electrolyte, a base electrolyte and a proton permeable dense phase separating the acid electrolyte from the base electrolyte (ABSTRACT). Smotkin et al disclose that their invention relates to electrolyte system for fuel cells operating in a temperature range up to about 300 °C (COL 1, lines 10-15).

**Figure 1** below illustrates the dense phase proton permeable material 17 separating acidic electrolyte-containing matrix layer 15 from basic electrolyte-containing matrix layer 16 (FIGURE 1/ COL 4, lines 44-55). It is disclosed that the dense phase proton permeable material comprises a foil of a metal hydride (COL 4, lines 57-64/ COL 3, lines 12-18). *Thus, the metal hydride foil serves as the support which is coated on both sides by respective electrolyte containing matrixes which represents the inorganic/composite non-liquid material.*

**FIG. 1**

Art Unit: 1745

**First Examiner's Note:** *since the recited "coating material" (i.e. "the inorganic or composite non-liquid material") covers a very large number of applicable materials which can be used therefor, it is also contended that "a coating material" comprising any non-liquid material would produce a component exhibiting the area-specific resistance (ASR) at the specific temperature range. Thus, such area-specific resistance (ASR) is an inherent characteristic or property of the respective electrolyte containing matrixes representing the inorganic/composite non-liquid material. That is, materials of at least similar compositions (i.e. any inorganic or composite non-liquid material) would be expected to have at least similar properties (See **MPEP 2112: Requirements of Rejection Based on Inherency; Burden of Proof**). Thus, the prior art coated component seems to be identical except that the prior art is silent as to an inherent property and/or characteristic. In that, it is noted that the extrinsic evidence makes clear that the missing descriptive matter is necessarily present in coated component described in the reference, and that it would be so recognized by persons of ordinary skill.*

**Second Examiner's Note:** *as to the specific preamble reciting "designed to serve as an electrolyte in a fuel cell", it is pointed out that the preamble refers to intended use. That is, the claim is directed to any component per se and such preamble is only a statement of ultimate intended utility.*

**Regarding claims 76-77 and 85-86:**

Smotkin et al teaches the use of palladium hydride as the metal hydride foil (COL 4, lines 56-65).

Therefore, the claims are anticipated by Smotkin et al'669. However, if the claims are not anticipated the claims are obvious as it has been held similar products claimed in terms of its

Art Unit: 1745

function, property and/or characteristic are obvious. *In re Best 195 USPQ 430 and In re Fitzgerald 205 USPQ 594*. See rationale and/or technical reason above to reasonably support the determination that the inherent function and/or characteristic necessarily flows from the teaching of the applied prior art.

7. Claims 75-77, 80-82, 84-86 and 89-91 are rejected under 35 U.S.C. 102(b) as anticipated by or, in the alternative, under 35 U.S.C. 103(a) as obvious over the WO 98/21777 publication (herein called "*the WO'777 publication*").

Regarding claims 75, 82, 84 and 91:

The WO'777 publication discloses a fuel cell electrode-electrolyte unit wherein the electrolyte is divided up into two electrolyte layers 4, 6 with a blocking layer 5 therebetween (ABSTRACT). The blocking layer is made from a palladium silver alloy. The electrolyte unit is suitable for fuel cells (ABSTRACT).

**Figure 1** below illustrates the palladium silver alloy foil layer 5 the two non-liquid electrolyte layers 4 and 6 (FIGURE 1). *Thus, the palladium silver alloy foil layer serves as the support which is coated on both sides by respective electrolyte layers which represents the inorganic/composite non-liquid material.*

Art Unit: 1745

**First Examiner's Note:** since the recited "coating material" (i.e. "the inorganic or composite non-liquid material") covers a very large number of applicable materials which can be used therefor, it is also contended that "a coating material" comprising any non-liquid material would produce a component exhibiting the area-specific resistance (ASR) at the specific temperature range. Thus, such area-specific resistance (ASR) is an inherent characteristic or property of the respective electrolyte containing matrixes representing the inorganic/composite non-liquid material. That is, materials of at least similar compositions (i.e. any inorganic or composite non-liquid material) would be expected to have at least similar properties (See **MPEP 2112: Requirements of Rejection Based on Inherency; Burden of Proof**). Thus, the prior art coated component seems to be identical except that the prior art is silent as to an inherent property and/or characteristic. In that, it is noted that the extrinsic evidence makes clear that the missing descriptive matter is necessarily present in coated component described in the reference, and that it would be so recognized by persons of ordinary skill.

**Second Examiner's Note:** as to the specific preamble reciting "designed to serve as an electrolyte in a fuel cell", it is pointed out that the preamble refers to intended use. That is, the claim is directed to any component per se and such preamble is only a statement of ultimate intended utility.

As to claims 76-77 and 85-86:

The WO'777 publication divulges that the blocking layer (the support) is made from a palladium silver alloy (ABSTRACT).

With reference to claims 80-81 and 89-90:

Art Unit: 1745

The WO'777 publication teaches that the palladium-silver layer has a thickness ranging from 5-50  $\mu\text{m}$  (page 4, lines 1-2/ page 5, lines 10-15). *In this case, it is noted that, at least, the end points (i.e. 5  $\mu\text{m}$  and/or 50  $\mu\text{m}$ ) also constitute a valid date point and thus it anticipates the claim as the end point represents a specific disclosure of a discrete embodiment of the invention disclosed by the prior art which amounts to a complete description and, therefore, an anticipation of the claimed range. See Ex Parte Lee 31 USPQ2d 1105.*

Therefore, the claims are anticipated by the WO'777 publication. However, if the claims are not anticipated the claims are obvious as it has been held similar products claimed in terms of its function, property and/or characteristic are obvious. *In re Best 195 USPQ 430 and In re Fitzgerald 205 USPQ 594.* See rationale and/or technical reason above to reasonably support the determination that the inherent function and/or characteristic necessarily flows from the teaching of the applied prior art.

### ***Claim Rejections - 35 USC § 103***

8. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

9. Claims 78-79 and 87-88 are rejected under 35 U.S.C. 103(a) as being unpatentable over Smotkin et al 5846669 as applied to claim 75 and 84 above, and further in view of the publication "Solid-State protonic conductors: principles, properties, progress and prospects" by T.Norby (hereinafter referred to as "*the Norby's publication*").

Art Unit: 1745

Smotkin et al'669 is applied, argued and incorporated herein for the reasons above.

However, Smotkin et al'669 does not expressly disclose the specific proton conductor material.

The Norby's publication teaches a solid-state protonic conductor (TITLE) which can be used in a fuel cell as a hydrogen permeable membrane (ABSTRACT). It is disclosed that protonic conductivity are candidates for electrolyte in fuel cells (INTRODUCTION). Norby discloses protonic conductors are electrolyte in which hydrogen is transported towards and evolved at the cathode. It is further disclosed that protonic transport includes transport of protons and any assembly that carries protons and/or proton exchange membranes (PEM) (Sections: 2. Principles of Protonic Conduction-Classes of Proton Conductors, & 4.1 Water-containing Systems: PEMs). The Norby's publication reveals that  $\text{Ba}_3\text{Ca}_{1.18}\text{Nb}_{1.82}\text{O}_{8.73}$  (BCN18) shows proton conduction (Section: 3. PROPERTIES). It is disclosed the use of hydrate  $\text{CsHSO}_4$  (SECTION: 2. Principles of Protonic Conduction- Classes of Proton Conductors/ FIGURE 1); and  $\text{SrHPO}_4$ ,  $\text{Sr}(\text{H}_2\text{PO}_4)_2$ , and  $\text{Ba}(\text{H}_2\text{PO}_4)_2$  (SECTION: 4.2 Low-Temperature inorganic proton conductors)

In view of the above, it would have been obvious to one skilled in the art at the time the invention was made to use the specific proton conductor material of the Norby's publication on the metal substrate base of Smotkin et al'669 because the Norby's publication discloses that such specific proton conductor materials are suitable solid-state protonic conductors which can be used in fuel cell applications such as hydrogen permeable membranes. Accordingly, such specific proton conductor material enhances the transport of protons for both chemical processes and energy conversion process (Section: 3. Properties).

10. Claims 78-79 and 87-88 are rejected under 35 U.S.C. 103(a) as being unpatentable over Smotkin et al 5846669 as applied to claim 75 and 84 above, and further in view of Crome et al 5985113.

Smotkin et al'669 is applied, argued and incorporated herein for the reasons above. However, Smotkin et al'669 does not expressly disclose the specific proton conductor material.

Crome et al also disclose the following:

As to claim 31:

Crome et al disclose the following (COL 9, lines 10-26):

For all described embodiments, it is envisioned that the electrolyte material can be selected from the following groups and mixtures thereof: 10

5) lanthanum gallate  $\text{La}_{1-x}\text{Sr}_x\text{Ga}_{1-y}\text{Mg}_y\text{O}_3$  where 25  
( $0 < x < 0.30$ )(where  $x=0.10$  is preferred) and ( $0.00 < y < 0.30$ )  
(where  $y=0.20$  is preferred).

Crome et al also envision that the electrolyte material can be selected from a variety of element groups and mixtures thereof including scandium (Sc) (CLAIM 12/ COL 9, lines 10-26).

Art Unit: 1745

*Thus, it is asserted that scandium (Sc) can replace gallium (Ga) in the ceramic composite chemical formula.*

In view of this disclosure, it would have been obvious to one skilled in the art at the time the invention was made to use the specific proton conductor material of Crome et al on the metal substrate base of Smotkin et al'669 as Crome et al teaches that, for all described embodiments, it is envisioned that the electrolyte material can be selected from a variety of groups and mixtures including an alternative use of scandium element (Sc) as this allows the fuel cell stack to operate in multiple temperature regions including the claimed temperature range and provides efficiency power systems. Moreover, Crome et al directly teach that scandium (Sc) can be a doping element which might substitute or replace any element in electrolyte composite materials. Further, those of ordinary skill in the art knows that scandium (Sc) element may be a substitute element in composite materials as both elements Sc and Ga shows the same chemical valence.

11. Claims 78-79 and 87-88 are rejected under 35 U.S.C. 103(a) as being unpatentable over Smotkin et al 5846669 as applied to claim 75 and 84 above, and further in view of the publication "Chemical stability and proton conductivity of doped BaCeO<sub>3</sub>-BaZrO<sub>3</sub> solid solutions" by Kwang Hyun Ryu et al (hereinafter referred to as "*the Kwang's publication*").

Smotkin et al'669 is applied, argued and incorporated herein for the reasons above. However, Smotkin et al'669 does not expressly disclose the specific proton conductor material.

The Kwang's publication teaches solid solutions such as BaCe<sub>0.9-x</sub>Zr<sub>x</sub>M<sub>0.1</sub>O<sub>3-δ</sub> where M is Gd or Nd and x ranges from 0-0.4 (ABSTRACT). It is disclosed that this composition gives a good compromise between conductivity and stability for fuel cell applications (ABSTRACT).

Art Unit: 1745

In light of the above, it would have been obvious to one skilled in the art at the time the invention was made to use the solid composition of the Kwang's publication as the specific proton conducting material on the metal substrate base of Smotkin et al'669 because the Kwang's publication teaches this composition gives a good compromise between conductivity and stability for fuel cell applications as it has been found that this composite compound exhibits both high conductivity, good stability and an increased in the activation energy for proton transport.

12. Claims 78-79 and 87-88 are rejected under 35 U.S.C. 103(a) as being unpatentable over Smotkin et al 5846669 as applied to claim 75 and 84 above, and further in view of the publication "Proton and oxide ion conductivity of doped LaScO<sub>3</sub>" by Dorthe Lybye et al (hereinafter referred to as "*the Dorthe's publication*").

Smotkin et al'669 is applied, argued and incorporated herein for the reasons above. However, Smotkin et al'669 does not expressly disclose the specific proton conductor material.

The Dorthe's publication teaches that conductivity of La<sub>0.9</sub>Sr<sub>0.1</sub>Sc<sub>0.9</sub>Mg<sub>0.1</sub>O<sub>3</sub> has been studied (ABSTRACT), particularly at 400°C (Section: 2. EXPERIMENTAL). It is also disclosed that the conductivity measurements suggests that La<sub>0.9</sub>Sr<sub>0.1</sub>Sc<sub>0.9</sub>Mg<sub>0.1</sub>O<sub>3</sub> is also a proton conductor (Section: 3. RESULTS and DISCUSSIONS).

In light of the above, it would have been obvious to one skilled in the art at the time the invention was made to use the compound of the Dorthe's publication as the specific proton conducting material on the metal substrate base of Smotkin et al'669 because the Dorthe's publication teaches that such compound exhibit excellent proton conduction at temperatures

Art Unit: 1745

below 700°C. Accordingly, the specified compound is a proton conductor showing satisfactory ionic conductivity.

### ***Response to Arguments***

13. Applicant's arguments filed on 11/22/04 have been fully considered but they are not persuasive.

14. Applicant has provided a variety of arguments throughout the entire Remark section of the foregoing amendment. The main and principal arguments can be essentially summarized as follows: a) *"no reference was cited that discloses a coating of an electronically-insulating proton-conducting (EIPC) material that is an inorganic or composite non-liquid on a metal or metal hydride support"*; b) *"No motivation has been shown for combining the permeability barriers of Smotkin or WO '777 with any of the disclosed EIPC materials"*; c) *"...there is objective evidence of nonobviousness in Norby..."*.

15. With respect to applicant's arguments regarding the electronically-insulating proton-conducting (EIPC) material being an inorganic or composite non-liquid, the examiner briefly states that applicant's claim interpretation differs from the examiner's claim interpretation. In that, it is further stated that the specific claim language *"an inorganic or composite non-liquid material"* has been construed as reciting either an inorganic material per se or a composite non-liquid material. Accordingly, this interpretation permits the inclusion of any inorganic material as well as any composite non-liquid material. In contrast, applicants now argue that such claim language specifically refers to either an inorganic non-liquid material or a composite non-liquid material. The examiner respectfully disagrees with applicant's claim interpretation. Accordingly,

Art Unit: 1745

in its broadest-semantically reasonable interpretation, it is strenuously contended that the present claim language encompasses two extremely large groups of materials: a ) any inorganic material (regardless of its state {liquid, solid or gas or plasma}), or b) any composite non-liquid material.

That's why it is reiterated that the coating materials of the prior art fully satisfy the claimed requirement of being either an inorganic material (i.e. Smotkin's concentrated phosphoric acid in a silicon carbide matrix or concentrated potassium hydroxide in a potassium hexatitanate matrix) or composite non-liquid material (i.e. Smotkin's Nafion 115 polymer or the WO'777 free-standing polymer membrane).

16. In response to applicant's argument that “*No motivation has been shown for combining the permeability barriers of Smotkin or WO'777 with any of the disclosed EIPC materials*”, the fact that applicant has recognized another advantage/disadvantage which would flow naturally from following the suggestion of the prior art cannot be the basis for patentability when the differences would otherwise be obvious. See *Ex parte Obiaya*, 227 USPQ 58, 60 (Bd. Pat. App. & Inter. 1985).

17. Concerning applicant's arguments regarding the applicability and validity of the *Norby* reference, it appears that applicant is attempting to disqualify or discredit the teachings of all prior art references based upon *Norby's* singular findings. That is to say, applicant is apparently of the opinion that the authenticity and soundness of the technical and scientific evidence of *Norby's* findings is strong enough that no other reference (prior art) at all can be cited or used, for technical and objective purposes, in view of *Norby's* finding. The examiner again respectfully disagrees with applicant's position. Furthermore, the examiner makes no comments about the validity, applicability, authenticity or technical authority of both the *Norby's* findings

Art Unit: 1745

and/or the prior art of record. The prior art of record has been cited hereinabove because they, in fact, discloses substantially the same subject matter that applicant is intending to claim as the invention. As a consequence, applicant's arguments including any vis-à-vis comparison between the prior art of record and the Norby's finding lacks validity in its entirety, and thus, they have been fully discarded, deemed inappropriate, and not considered on their merits.

18. In addition, the examiner also wishes to briefly address other arguments raised by the applicant on the Remark section.

19. In response to applicant's argument that the references fail to show certain features of applicant's invention, it is noted that the features upon which applicant relies (i.e., "*Yet the Nafion component prevents structures such as those in the cited references from operating in the desired temperature range, i.e. much above 100 °C...*") are not recited in the rejected claim(s). Although the claims are interpreted in light of the specification, limitations from the specification are not read into the claims. See *In re Van Geuns*, 988 F.2d 1181, 26 USPQ2d 1057 (Fed. Cir. 1993).

20. In response to applicant's argument that the examiner's conclusion of obviousness is based upon improper hindsight reasoning, it must be recognized that any judgment on obviousness is in a sense necessarily a reconstruction based upon hindsight reasoning. But so long as it takes into account only knowledge which was within the level of ordinary skill at the time the claimed invention was made, and does not include knowledge gleaned only from the applicant's disclosure, such a reconstruction is proper. See *In re McLaughlin*, 443 F.2d 1392, 170 USPQ 209 (CCPA 1971).

Art Unit: 1745

21. In response to applicant's argument that there is no suggestion to combine the references, the examiner recognizes that obviousness can only be established by combining or modifying the teachings of the prior art to produce the claimed invention where there is some teaching, suggestion, or motivation to do so found either in the references themselves or in the knowledge generally available to one of ordinary skill in the art. See *In re Fine*, 837 F.2d 1071, 5 USPQ2d 1596 (Fed. Cir. 1988) and *In re Jones*, 958 F.2d 347, 21 USPQ2d 1941 (Fed. Cir. 1992).

*In this case, the applied references are combinable between them simply because they all address the same problem of providing suitable membrane components per se as instantly claimed.*

22. In response to applicant's argument that “*Smotkin use a Pd or other metal or metal hydride in addition to a polymer membrane EIPC layer for one stated reason: it prevents diffusion of carbon dioxide or fuels such as methanol across the membrane assembly...*”, the fact that applicant has recognized another advantage/disadvantage which would flow naturally from following the suggestion of the prior art cannot be the basis for patentability when the differences would otherwise be obvious. See *Ex parte Obiaya*, 227 USPQ 58, 60 (Bd. Pat. App. & Inter. 1985).

23. Arguments that the alleged anticipatory prior art is “*nonanalogous art*” or “*teaches away*” from the invention’ or is not recognized as solving the problem solved by the claimed invention, are not germane to a rejection under section 35 USC 102. *Twin Disc, Inc. v. United States*, 231 USPQ 417, 424. See also *State Contracting & Eng’g Corp. v. Condotte America, Inc.*, 346 F.3d 1057, 1068, 68 USPQ2d 1481, 1488 (See MPEP 2131.05 [R-2] **Nonanalogous Art**).

Art Unit: 1745

24. In response to applicant's arguments that "*When saying it would be obvious to combine references that teach other EIPC materials with the teachings of Smotkin or WO'777, the office assumes, without explaining, that such barrier function would also be desirable in combination...*" and/or "*There is no basis in the references to expect the claimed combination to succeed*", since the prior art references do not provide any indication that such materials are specially restricted to any particular system and/or environment as speculated by the applicants, the burden is shifted to the applicants to provide objective evidence demonstrating that such other EIPC materials when used as applied in the membrane of Smotkin or the WO'777 will indeed cause detrimental effects thereto. That is to say, the burden is shifted to the applicants to supply, provide or present objective evidence showing why such other EIPC materials cannot function in a substantially similar membrane structure.

25. In response to applicant's argument that the references fail to show certain features of applicant's invention, it is noted that the features upon which applicant relies (i.e., "*the support is coated with the EIPC material so that the two are interfaced well enough to provide proton conductivity through the multilayer composite*" or "*intimate interface*") are not recited in the rejected claim(s). Although the claims are interpreted in light of the specification, limitations from the specification are not read into the claims. See *In re Van Geuns*, 988 F.2d 1181, 26 USPQ2d 1057 (Fed. Cir. 1993). *The present claims are absolutely silent as to the specific interfacing limitation; they just recite "a coating" regardless of its specific interfacing, embedding, interconnecting and/or adhesiveness structure. In the absence of a specific definition of what constitutes "a coating" per se, it is contended that "a coating" is any layer or film material.*

Art Unit: 1745

26. In response to applicant's argument that “...*then hot-presses the polymer membrane onto the treated foil, which ensures that the ion-conducting polymer is intensively bound to the surface of the interlayer*”, the fact that applicant has recognized another advantage/disadvantage which would flow naturally from following the suggestion of the prior art cannot be the basis for patentability when the differences would otherwise be obvious. See *Ex parte Obiaya*, 227 USPQ 58, 60 (Bd. Pat. App. & Inter. 1985).

27. Applicant has contended that “*The cited references provide no guidance on the preparation or properties of coating of such EIPC materials on any support*”. In the same manner, the present claims also fail to provide guidance on such preparation. Thus, such “no guidance” argument is equally applicable to both the present claim language and the prior art of record.

28. In response to applicant's argument that “*the reference state that the Nafion membranes only operates at temperatures where they are hydrated-see Norby*”, the fact that applicant has recognized another advantage/disadvantage which would flow naturally from following the suggestion of the prior art cannot be the basis for patentability when the differences would otherwise be obvious. See *Ex parte Obiaya*, 227 USPQ 58, 60 (Bd. Pat. App. & Inter. 1985).

29. In response to applicant's argument that the references fail to show certain features of applicant's invention, it is noted that the features upon which applicant relies (i.e., “*The ASR limitation is included to limit the thickness of the coating*”) are not recited in the rejected claim(s). Although the claims are interpreted in light of the specification, limitations from the specification are not read into the claims. See *In re Van Geuns*, 988 F.2d 1181, 26 USPQ2d 1057 (Fed. Cir. 1993). *The present claims do not recite any particular thickness at all.*

Art Unit: 1745

*Moreover, applicant's attempt to equate the limitation ASR to thickness is completely out of place in view of lack of scientific evidence which correlates the ASR to thickness.*

30. In response to applicant's arguments that "...since the present application relates fuel cell construction, references to hydrogen permeable membrane, even if used in conjunction with a fuel cell, are arguably non-analogous art", it is merely contended that the present claims are directed to "**a component**" per se. In other words, the present claims are not directed to "**a fuel cell**" itself; therefore, applicant's argument are not commensurate in scope with the invention.

31. In response to applicant's argument that "...Crome is really non-analogous art..." is nonanalogous art, it has been held that a prior art reference must either be in the field of applicant's endeavor or, if not, then be reasonably pertinent to the particular problem with which the applicant was concerned, in order to be relied upon as a basis for rejection of the claimed invention. See *In re Oetiker*, 977 F.2d 1443, 24 USPQ2d 1443 (Fed. Cir. 1992). *In this case, the mere fact that Crome discloses the materials can be electrolyte provides sufficient guidance to those of ordinary skill in art to combine Crome's teachings or, at least, potentially consider Crome's teachings as possible electrolytic features.*

32. With respect to applicant's argument concerning that "*the fact that Sc is among the variety of groups and mixtures enumerated in the reference does not render it "obvious" in the absence of guidance that would lead one to select that particular tree from among the forest of alternatives and mixture thereof*", the examiner positively contends that the prior art of record specifically named "Sc". It is additionally asserted that the generic chemical formula of a prior art does anticipate the claimed species covered by the formula when the species can be "**at once envisaged**" from the formula. That is, when the compound is not specifically named, but instead

Art Unit: 1745

it is necessary to select portions of teachings within a reference and combine them, e.g., select various substituents from a list of alternatives given for placement at specific sites on a generic chemical formula to arrive at a specific composition, anticipation can only be found if the classes of substituents are sufficiently limited or well delineated. If one of ordinary skill in the art is able to “at once envisage” the specific compound within the generic chemical formula, the compound is anticipated. In this case, it is stated that the prior art of record clearly names or identifies the claimed Sc element, if not, at least the prior art of record does envisage the use of the claimed Sc element.

33. With respect to applicant’s arguments that “*The composition in Kwang do exhibit at least some proton conductivity, however, their properties are not well explored*” and “*...Kwang is an investigation in progress...*”, it is noted that a newly discovered property does not necessarily mean the product is unobvious, since this property may be inherent in the prior art. *In re Best 195 USPQ 430; In re Swinehart 169 USPQ 226.*

34. In response to applicant’s arguments that “*Lybye discusses  $\text{La}_{0.9}\text{Sr}_{0.1}\text{Sc}_{0.9}\text{Mg}_{0.1}\text{O}_3$  and present results that  $\text{La}_{0.9}\text{Sr}_{0.1}\text{Sc}_{0.9}\text{Mg}_{0.1}\text{O}_3$  is not only an oxide conductor but also a proton conductor...the reference teaches that this material was also found to have substantial p-type conductivity...is thus at best a mixed conductor*”, it is noted that products of identical chemical composition can not have mutually exclusive properties, and thus, the claimed property of being electronically-insulating proton-conducting (EIPC) is necessarily present in the prior art material. On the other hand, assuming arguendo that  $\text{La}_{0.9}\text{Sr}_{0.1}\text{Sc}_{0.9}\text{Mg}_{0.1}\text{O}_3$  does not exhibit the claimed EIPC property (as argued by the applicant), it can thus be reasonably stated that applicant’s  $\text{La}_{0.9}\text{Sr}_{0.1}\text{Sc}_{0.9}\text{Mg}_{0.1}\text{O}_3$  material also fails to exhibit such claimed EIPC property (← **emphasis**

Art Unit: 1745

**added**). Thus, applicant's claim that his  $\text{La}_{0.9}\text{Sr}_{0.1}\text{Sc}_{0.9}\text{Mg}_{0.1}\text{O}_3$  material is indeed an EIPC material may be incorrect, ill-founded and misleading. Applicant is courteously required to explain or clarify this issue; otherwise it may be further understood that such material or other claimed materials are not EIPC materials (← **emphasis added**).

### ***Conclusion***

35. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Raymond Alejandro whose telephone number is (571) 272-1282. The examiner can normally be reached on Monday-Thursday (8:00 am - 6:30 pm).

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Patrick J. Ryan can be reached on (571) 272-1292. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
